## ONE DAY NATIONAL SEMINAR ON “ANTIBIOTIC USE:PAST, PRESENT & FUTURE”

Defeat of the dangerous infectious diseases was prophesied since 1940, with the discovery of the antimicrobials. Antibiotics are the most commonly and largely used group of medicines in practice, used to treat & prevent the bacterial infections. In present days we find them pose many problems that arise due to irrational & inappropriate use, inadequate precautions, inadequate knowledge etc., which leads to the development of antibiotic resistance.

Antibiotic resistance is a global concern, which can affect anyone, of any age, of any gender of any country. Thus, adding to the cost of health care management due to prolonged hospital stay, poor prognosis and increased mortality. Use of antibiotics without the prescription, lack of the standard treatment guidelines, over prescription or over use by the public as self-medication, availability of counterfeit preparations have worsened the emergence and spread of the resistance.

Since the hospital acquired infections, community acquired infections are emerging as independent epidemics, or resistance, it is time for a global effort to curb the problem of antibiotic resistance or else it can cause a dangerous situation in which, common infections will remain uncured or may even end with fatal outcome. It may lead the current high-tech world into the dangerous situation and the world may find itself back in the dark ages of medicines.
